

Instructions for use

(Use Lianol ferti for at least 5 months for a good and well-founded evaluation)

I - Which sows?

Make an analysis of the fertility of the farm per parity:

- A: Problem with 2^e en 3^e parity sows? A common cause is an energy problem. Administer Lianol ferti to sows that lost weight and to 2^e/3^e parity sows.
- B: Problem with all the sows? A common cause is farm management and/or the breeding moment. Administer Lianol ferti to all the sows and pay attention to underlying causes.

II - What to do before weaning

- Mark the sows to be treated 1 week before weaning.
- This by means of a color marking on the sow and on the sow card.
- Start the treatment 2 to 3 days before weaning.
- Give the tablet into the trough before feeding for a confirmed uptake.

III - What to do at weaning

- Place the treated sows together.
- Don't place juvenile sows next to each other. This is negative for heat signalling.
- Give these sows a tablet at the day of weaning and for 2 to 3 days afterwards.

IV - Summary

- 1 tablet per day.
- 2 to 3 days before weaning, on the weaning day itself and 2 to 3 days after weaning.
- In total: 5 tablets per sow and 7 tablets for the 1st litter sow!
- Take into account: the condition of the sow - breeding moment - light - boar.
